

Fruitone® L

It's Thinning Time!

Why thin?

- To improve fruit shape and size
- To improve fruit colouring
- To encourage good annual cropping
- To encourage return bloom
- To increase profitability

How to proceed

- Use 10 ppm (319 mL/1000 L of water) for fruits with an average diameter of 10 mm
 - Increase rate if fruit diameter is bigger *or* if fruit setting is good or strong
 - Decrease rate for early thinning *or* if fruit setting is average or low
- Use at least 500 L of water per hectare
- Ideal application temperature is between 21°C and 24°C with weather conditions ensuring slow drying
- Do not apply when temperature is below 16°C or above 27°C
- Fruitone L can also be used in combination with Sevin XLR
- Thinning fruits bigger than 15 mm can cause malformation
- For superior results, spray jet should be directed to the upper 2/3 of the tree canopy
- Add LI 700 (1 L/1000 L of water):
 - For its acidifying action (Fruitone L requires an acid pH)
 - For its surfactant properties (wetting action)
