Katalyst®

FUEL YOUR CROP TO PROTECT ITS YIELD

KATALYST is a highly available form of liquid potassium engineered with Reacted Carbon Technology. This allows for better penetration into the leaf by transporting more potassium ions across the leaf surface and into the leaf before spray dries on the leaf, preventing penetration.

WHAT YOU GET WITH A FOLIAR APPLICATION OF KATALYST

- HIGH ANALYSIS POTASSIUM SOURCE WITH LOW SALT TOXICITY
- RAPID POTASSIUM PENETRATION AND UPTAKE INTO THE LEAF
- COMPATIBLE EASY TO USE FORMULATION
- 5% ACTAGRO ORGANIC ACID COMPLEX

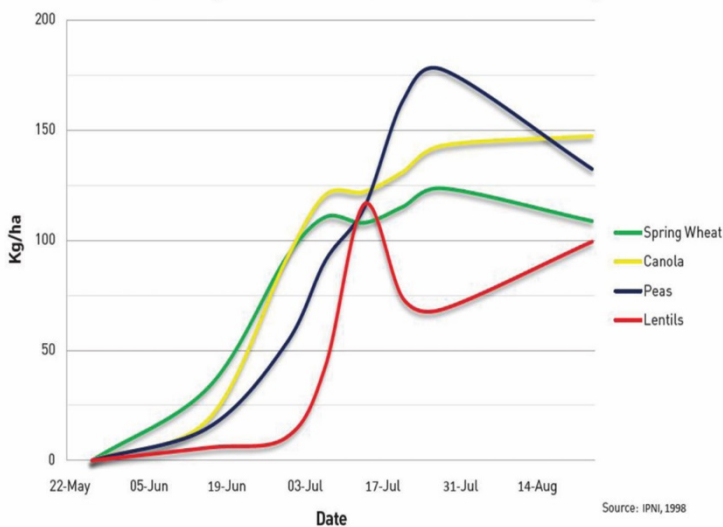

WHY DO YOU NEED TO CONSIDER A FOLIAR APPLICATION OF POTASSIUM?

Potassium is required for numerous plant growth processes including the movement of water, nutrients and sugars within the plant. When the high demand for potassium is not met by nutrient availability in the soil, growth and development are affected leading to lower yield potential and crop quality.

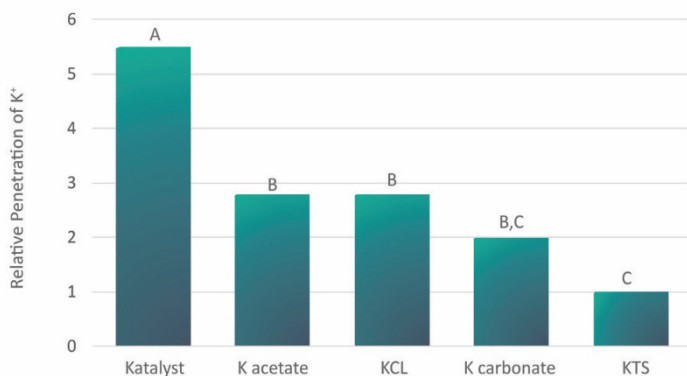

Application rate of 2-4 L/acre of KATALYST from late vegetation to early flowering of your crop will:

- Improve water use efficiency in the plant
- Increase stalk strength
- Aid to increase protein content in seed
- Drive the rate of photosynthesis
- Maximize your yield potential

Potassium Uptake & Demand for Selected Crops

K+ Cuticle Penetration
