

Pod-Stik™

Advantages

What is it?

- **Pod-Stik** is a unique latex blend, specifically developed to dramatically reduce the quantity of seed shed from canola/pea pods which split before and during harvest
- It does not slow down crop drying, and has no adverse effects on maturity or quality of seed produced
- It can be applied when the pods are a light green colour and still pliable (approximately 3 weeks before harvest).
- It has been used in several European countries and was successfully introduced into Canada in 2008

Pod-Stik™ - Optimum Application Timing

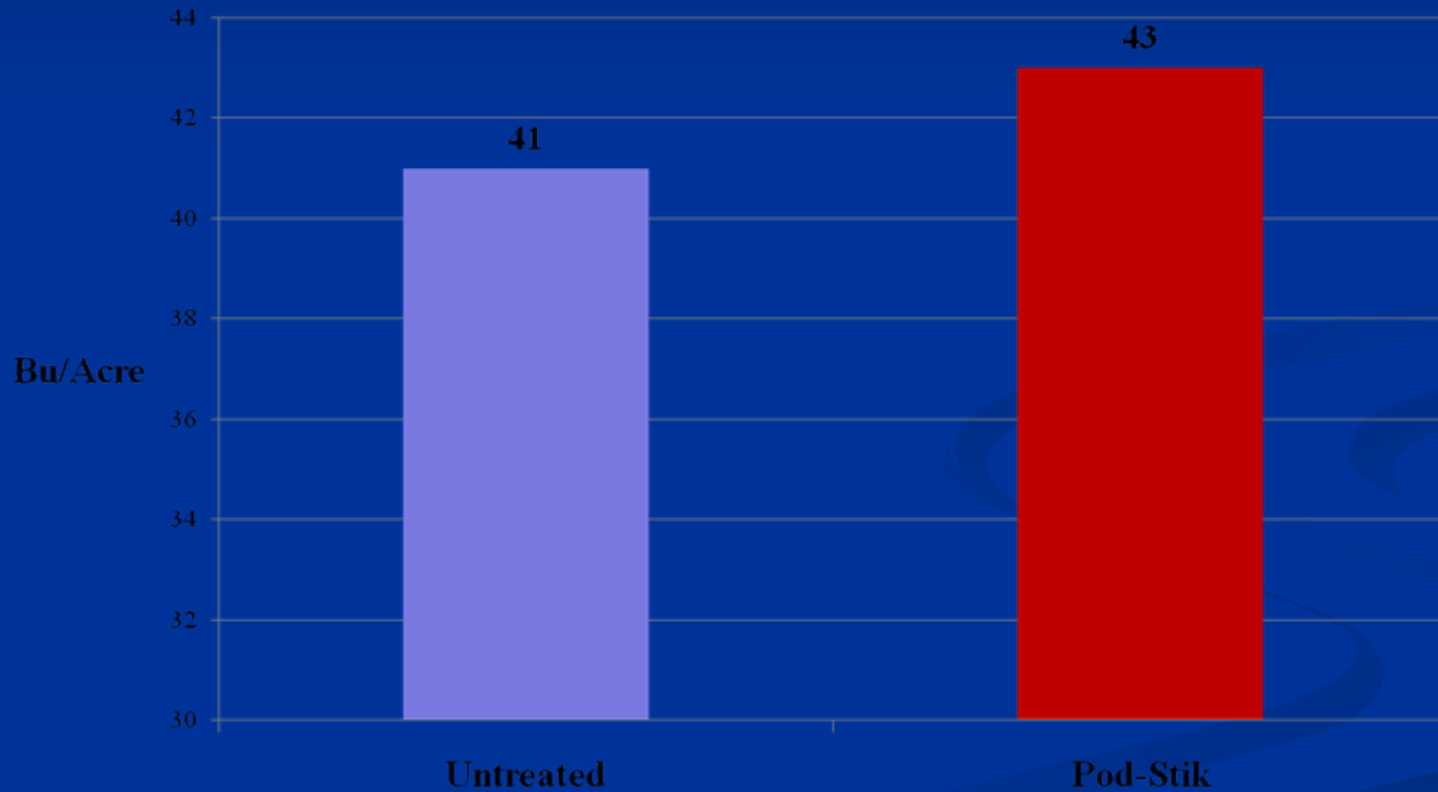

Around 3 weeks prior to harvest when the pods are light green (40-60% colour change)

Pods are still pliable and can be bent into a U or V shape without splitting.

Pod-Stik Grower Trials Western Canada 2008
